

CENTER Abstract

CENTER is an immersive music composition that uses 3D spatial audio to represent love as an emotional center. The piece is entirely created using the human voice, including harmonies, vocal bass, percussion, adlibs, and vocal chops. Based on a soft jazz-pop harmonic progression, the composition combines vocal layering and spatial distribution to create an intimate environment.

Each element is positioned according to its emotional intention and frequency range, creating clarity and spatial balance throughout the mix. The lead vocal acts as the main dynamic element, following the lyrical narrative through azimuth movement, elevation, width variation, or additional Ambisonic reverberation.

Different vowels are intentionally used as timbral sources due to their unique formants and resonant frequencies, allowing the voice to behave as multiple instruments while maintaining a unified sonic identity.

Through vocal-only instrumentation and movement linked directly to the lyrics, *CENTER* transforms emotional centrality into a physical listening experience.
